

Project Amphoreus — Roadmap

Ultimate Goal

Reproduce the **digital forms of all Chrysos Heirs** as AI models, each sharing the same personality, knowledge, memories, speech patterns, and behavioral traits as the original characters from Honkai: Star Rail.

Phase 0 — Foundation & Knowledge Base (Weeks 1–3)

Objective: Build the definitive, structured corpus of all Chrysos Heir lore before any model work begins.

Milestone 0.1 — Character Profile Registry

For each of the 12 Chrysos Heirs, document:

Field	Description
Identity	Name(s), titles, aliases, race, origin city-state
Coreflame & Titan	Associated Coreflame, Titan name, divine authority
Primum Mobile	Coded drive (e.g., Concord, Hatred, Desire)
Simulated Path	Aeon Path simulated (Harmony, Destruction, etc.)
Personality	Core traits, temperament, emotional range, moral alignment
Fatal Flaw (Hamartia)	Greek-tragedy-inspired flaw/curse
Speech Patterns	Formality level, verbal tics, vocabulary range, tone
Relationships	Dynamics with other Heirs, faction loyalties, rivalries
Biography	Origin story, key life events, trajectory through the story

Field	Description
Knowledge Domain	What this Heir knows — combat, politics, philosophy, science, etc.
Canon Dialogues	Collected in-game quotes, voice lines, story excerpts

Milestone 0.2 — World Ontology

- Amphoreus world rules, Eternal Recurrence mechanics
- The Amphoreus Experiment (Scepter δ-me13) internal logic
- Black Tide, Destruction Equation, golden blood (ichor)
- City-states: Okhema, Janusopolis, Castrum Kremnos, Grove of Epiphany, Styxia, Aidonia
- The 12-factor system and electrical signal framework

Milestone 0.3 — Canon Source Index

- Index all Trailblaze Mission chapters set in Amphoreus (versions 3.0–3.7)
- Index all Character Stories, Voice-Overs, Readables
- Index all HoYoLAB articles, trailers, animated shorts
- Index all in-game Data Bank entries

Phase 1 — Architecture Design (Weeks 4–5)

Objective: Define the technical approach for AI Chrysos Heir models.

Milestone 1.1 — Approach Decision

Evaluate and select among:

Approach	Description	Pros	Cons
LLM Persona Prompting	System prompts + character cards for existing LLMs	Fast, low-cost	Limited depth, prompt injection risk
Fine-tuned Models	LoRA/QLoRA fine-tunes per character	Deep personality capture	Expensive, 12 separate models
RAG + Persona	Retrieval-Augmented Generation with character	Knowledge-grounded,	Requires vector DB, slower inference

Approach	Description	Pros	Cons
	lore base	updatable	
Multi-Agent Framework	Each Heir as an agent in a shared simulation	Enables inter-character dynamics	High complexity

Likely recommended path: Hybrid — RAG-backed persona prompting for prototyping, with selective fine-tuning for flagship characters.

Milestone 1.2 — Tech Stack Selection

- Base LLM selection (open-source vs. API-based)
- Vector database for knowledge retrieval
- Character card format (Character.AI-style, SillyTavern, custom JSON schema)
- Inference infrastructure (local GPU vs. cloud)
- Conversation memory / context management

Milestone 1.3 — Evaluation Framework

- Define metrics: personality fidelity, knowledge accuracy, dialogue consistency
- Build a test suite of character-specific Q&A and scenario prompts
- Establish human evaluation protocol (blind A/B testing)

Phase 2 — Pilot Character: Phainon (Khaslana) (Weeks 6–8)

Objective: Build the first complete Chrysos Heir AI as proof-of-concept.

Why Phainon?

- Central protagonist role, most screen time and dialogue
- Complex arc: hero → prisoner of flames → Worldbearing demigod
- Primum Mobile "Hatred" / Destruction Path — rich emotional range
- Well-documented relationships with all other Heirs

Milestone 2.1 — Phainon Knowledge Corpus

- Extract all Phainon dialogue, character stories, voice lines
- Document his relationship map
- Collect fan translations and community analysis

Milestone 2.2 — Phainon AI Model (v1)

- Build character card / system prompt
- Implement RAG pipeline with Phainon-specific knowledge base
- Deploy first testable version

Milestone 2.3 — Phainon Evaluation & Iteration

- Run evaluation suite
- Human review of dialogue samples
- Iterate prompt, RAG, and parameters
- Document lessons learned for scaling

Phase 3 — Core Twelve: Batch Development (Weeks 9–20)

Objective: Build AI models for all remaining 11 Chrysos Heirs, one per week.

Tier 1 — High Priority (Weeks 9–11)

Characters with the most narrative weight and dialogue:

Week	Heir	Coreflame	Key Trait
9	Aglaea	Romance	Weaver, political leader, cold pragmatist
10	Mydei	Strife	Warrior-king, honor-bound, Kremnos champion
11	Castorice	Death	Servant of afterlife, gentle but burdened

Tier 2 — Mid Priority (Weeks 12–16)

Week	Heir	Coreflame	Key Trait
12	Tribbie	Passage	Holy Child, tri-personality (Tribbie/Trianne/Trinnon)
13	Anaxa	Reason	Scholar, skeptic, Grove of Epiphany intellectual
14	Cyrene	Time / Genesis	Demiurge, central mystery, Trailblaze Path
15	Hyacine	Sky	Healer, skyfolk, devoted to Aquila
16	Cipher	Trickery	Thief, rogue, Elation-aligned trickster

Tier 3 — Extended Set (Weeks 17–20)

Week	Heir	Coreflame	Key Trait
17	Cerydra	Law	Monarch, judge, Order-aligned
18	Hysilens	Ocean	Sea siren, Nihilism-aligned, self-negating
19	Terravox	Earth	Seismic dragon, Dromas, Permanence-aligned
20	Dan Heng • Permensor Terrae	Earth (alt.)	Vidyadhara, Express crew, alternate cycle Heir
20	Evernight (March 7th)	Time (alt.)	Amnesiac guest, alternate cycle Heir

Phase 4 — Inter-Character Dynamics (Weeks 21–24)

Objective: Enable authentic multi-character interactions.

Milestone 4.1 — Relationship Graph Engine

- Build a structured graph of all inter-Heir relationships
- Encode dynamics: trust, rivalry, mentorship, romance, betrayal history
- Implement dynamic relationship state that evolves through conversation

Milestone 4.2 — Group Conversation System

- Multi-agent orchestration (Heirs talking to each other + user)
- Turn-taking, interruption modeling, group dynamics
- Shared context / memory across agents in a session

Milestone 4.3 — Scenario Simulation

- Recreate key canon scenes (Nikador battle, Coreflame trials, Council of Elders)
- Allow user-driven alternate-history scenarios
- "What-if" branching dialogues

Phase 5 — Quality Assurance & Refinement (Weeks 25–28)

Milestone 5.1 — Cross-Character Consistency Audit

- Verify that all Heirs' knowledge of shared events is consistent
- Check for anachronisms (post-story knowledge in pre-story setting)
- Validate relationship graph accuracy against canon

Milestone 5.2 — Personality Fidelity Benchmark

- Blind evaluation: present Heir dialogues alongside canon excerpts
- Community feedback integration (if applicable)
- Target: >90% accuracy on character identification by knowledgeable players

Milestone 5.3 — Edge Case Hardening

- Handle out-of-character questions gracefully
- Handle meta-knowledge (the Heir knows they're in a simulation? post-main-story awareness?)
- Graceful degradation when RAG context is insufficient

Phase 6 — Platform & Delivery (Weeks 29–32)

Milestone 6.1 — Interface Design

- Chat UI for one-on-one conversations with individual Heirs
- Group chat UI for multi-Heir conversations
- Character selection / switching mechanism

Milestone 6.2 — Deployment

- Local deployment package (Ollama / llama.cpp compatible)
- Cloud-hosted option (if desired)
- API for programmatic access

Milestone 6.3 — Documentation

- User guide
- Character profiles reference
- Technical architecture documentation
- Contribution guide for community lore contributions

Phase 7 — Eternal Recurrence: Maintenance & Expansion (Ongoing)

- Track new game versions for additional Amphoreus lore
- Update character knowledge bases with new canon
- Community feedback loop for personality tuning
- Expand to non-Heir Amphoreus characters (Titans, NPCs, antagonists)
- Explore voice synthesis integration
- Explore visual avatar / Live2D integration

Critical Risks & Mitigations

Risk	Severity	Mitigation
Insufficient canon dialogue for minor Heirs	High	Fan translations, community wiki, inference from narrative context
LLM hallucination of non-canon knowledge	High	Strict RAG grounding, canonical guardrails, "I don't know" training
Copyright / fair use concerns	Medium	Non-commercial research project, transformative use, no game asset redistribution
Personality drift over long conversations	Medium	Periodic re-injection of character card, context window management
Multi-agent coherence breakdown	Medium	Central orchestrator, shared world-state, conflict resolution protocol

Success Criteria

1. **Fidelity:** A knowledgeable HSR player cannot distinguish an AI Heir's dialogue from canon dialogue in a blind test.
2. **Completeness:** All 12+ Chrysos Heirs are modeled with individually distinct personalities.
3. **Interaction:** Multiple Heirs can engage in coherent, in-character group conversations.
4. **Grounding:** No AI Heir produces knowledge that contradicts established canon.
5. **Sustainability:** The system can be updated as new game content is released.
